Chemtrails: Suppression of Human Evolution

By Montalk <montalk@hotmail.com>

<http://educate-yourself.org/mnt/ctsuppressionhumanevolution29sep00.shtml>

Sept. 29, 2000

The author has monitored the chemtrail situation for the past year and a half, but refrained from writing an article about it until adequate data had been gathered to formulate a viable theory that was both original and more explanatory than any other out there. This theory was wrought both by contradiction and by positive proof. In other words, it exists because other explanations do not hold water. The impossible is eliminated, and what is left over, no matter how improbable, must be close to the truth. In this article, sample references will be given as positive proof, and the contradictory evidence shall be summarized below. Note that the sample references are merely samples, and not which this article's validity hinges upon.

Three Faulty Theories Seeking to Explain Chemtrails

Chemtrails are unusually persistent airplane contrails with impacts upon weather and the health of those exposed to chemtrail fallout. They have been sighted in many countries and during all hours of the day and night, though chemtrail spraying usually begins early in the morning and slows in the evening. Air crafts involved in this phenomenon are commercial and military planes, the latter identifiable by traveling in areas and directions otherwise restricted for commercial flights.

As pointed out in Stan and Holly Deyo's May 31'st Newsletter, there are three major theories concerning an explanation of the chemtrail phenomenon:

- 1) weather modification
- 2) mass inoculation
- 3) population control

These theories do not adequately explain the range of data gathered.

Weather Modification

The weather modification theory arises from two clues, first that increasing cloudiness and precipitation sometimes occurs after a day of spraying, and second that EDB (ethylene dibromide or dibromethane) has been found in chemtrail fallout. Ethylene dibromide has similar effects on cloud formation as silver iodide, a chemical normally

used in cloud seeding.

But this theory does not explain the presence of genetically engineered viruses and bacteria in chemtrail residue, or the resulting epidemic of flu-like symptoms.

If anything, EDB serves partly as a condensation nuclei around which water vapor in the atmosphere can condense, making thick chemtrails visible for satellite tracking.

Mass Inoculation

The mass inoculation theory is more viable, as aerosol dispersion of vaccines is certainly possible as mentioned in a previous post. The government has put effort into vaccinating its military forces against anthrax. Supposedly, chemtrails are an attempt to vaccinate the entire population against anthrax.

But why would anthrax be the only agent, if not the major one, used in such an attack? There are others just as effective and easily dispersible. And with all the exposure of our bioterrorism efforts to protect against anthrax, what terrorist group would be dumb enough to choose something military forces, and possibly with chemtrails the entire population, are already vaccinated against?

The government is suspiciously certain that anthrax will be the method of choice, implying factions within, and not domestic or foreign terrorists, will be the initiators of such an attack.

Furthermore, spraying is occurring worldwide. Foreign governments are putting money and risk into spraying their respective populations. Since America would be the target of any such attack, spraying the rest of the world is a waste of money and time. Fact is, biological attacks are too localized an event to account for global spraying.

The secrecy of the chemtrail phenomenon puts it into the domain of black budget projects and shadow government operations. It is unwise to claim that the shadow government (the same one responsible for the Gulf War Syndrome cover-up, dangerous biological testing upon unsuspecting American citizens, avocation of fluoride in public water supplies, forceful suppression of alternative medicinal and technological inventions, electronic harassment of dissenters, and murder of whistle blowers) is spraying Joe Schmoe in Oklahoma just so that he can live and contribute to the overpopulation problem.

Overpopulation

Which brings us to the point of overpopulation. If the world's population is indeed to be reduced as drastically as demanded by the World Health Organization and the World Wildlife Fund among many, people need to die, not just stop reproducing. Supposedly, chemtrails are an effort to accomplish this.

Single agent spraying, whereby what's being applied now to the population will eventually kill them, is unlikely. Right now, people are recovering from chemtrail

induced sickness. If single agent spraying was indeed the method, more people would be dead by now. And even with an agent possessing delayed lethality, the variability in immune responses among affected persons would result in some dying prematurely. Since chemtrail related deaths have been extremely low, the possibility of chemtrails containing delayed single agents is equally low.

Double agent spraying is another possibility. One benign agent is applied now, and its combination with an activator in the future would turn it lethal. The activator can be anything from another biological or chemical substances to electromagnetic fields such as those potentially generated by HAARP. The electromagnetic method is pure speculation and thus considered unlikely.

Applying the activator agent would result only in the deaths of those affected by the benign agent. This is a lot of work, hassle, and risk compared to just applying a single agent at that time and skipping ever having to deal with a benign agent. Why do double agent spraying and take the risk with visible chemtrails and whistle blowers now, when you can keep everything clandestine until that final day when you apply a lethal single application?

Double agent spraying is obviously not the method employed. Since single agent spraying has been discounted above, the "population control" theory does not hold.

With these major chemtrail theories discounted, a new theory is required to fit the data.

There are three pieces, chemtrails, gene therapy, and mass human mutation, that when put together, give rise to the following theory. So, let's take a look at the pieces of the puzzle in detail.

Piece 1: The Chemtrails

From the many analyses performed upon chemtrail residue samples and listed on the web, the following substances have been gathered and listed here (as mentioned in such sources as <http://www.egroups.com/message/fr2/126?> , <http://www.carnicom.com/bio1.htm>, and <http://members.tripod.com/conspiracy2/contrailsanalyzed.htm>)

1) **Ethylene dibromide** (dibromomethane) - Banned in 1984 by the EPA, EDB (C₂H₄Br₂) is a carcinogenic fuel additive and insecticide with a chloroform-like odor. It is claimed similar to silver iodide, which was once used for cloud seeding and weather modification purposes. When absorbed, EDB causes central nervous system depression and pulmonary edema, which is fluid accumulation in the lungs. Symptoms of pulmonary edema include shortness of breath, anxiety, wheezing, and coughing. It is extremely irritant to mucous membranes and the respiratory tract.

2) **Pseudomonas aeruginosa** - A common hardy bacteria that can be found in dirt (suggesting possible contamination of chemtrail ground samples) but commonly genetically engineered by companies as PathoGenesis for various purposes. The natural

strains have been found to contaminate hospitals and drinking water. When inhaled into immunosuppressed lungs such as those of victims with cystic fibrosis, forms slime clusters called biofilms which are virtual bunkers against immune system defenses and antibiotics. It can transfer horizontally, meaning between species, genetic information to the host via transduction and conjugation. Conjugation involves the bacteria injecting a genetic package called a plasmid via a 'handshake' into a host cell, which receives it and in effect makes it a part of its own DNA. Transduction is similar, but instead of the bacteria sending a plasmid into the host, it sends bacteriophages (viruses) that contain some of the original bacteria's DNA and implants it within the host's DNA.

3) **Pseudomonas fluorescens** - another strain of the Pseudomonas variety found most often in soil and on plants. On plants, it produces antibiotics which shield the plant from fungal and bacterial infections. Most likely a contaminant in the analysis.

4) **Enterobacteriaceae** - Includes E.coli and salmonella which are culprits in cases of food poisoning. Most interesting of the Enterobacteriaceae family is the Klebsiella genus, whose species is responsible for pneumonia infections.

5) **Serratia marcescens** - a dangerous pathogen that can cause pneumonia.

This link reports that

"One of the biggest experiments involved the use of Serratia marcescens being sprayed over San Francisco. This organism is especially nice because it produces a red/pink pigment when grown on certain media, which makes identification very easy. At one point, 5000 particles/minute were sprayed from the coastal areas inward. During this time, 1 man died(in the hospital) and 10 others became infected in what was described as "a mystery to doctors." Although the military never did many follow up studies on these tests, one results was that it showed nearly every single person became infected with the test organism. In hindsight, now that some of this information has become declassified, it's been shown that during periods following spraying tests, there were 5-10 times the normal infections reported."

Visit this link from the Canadian Intelligence Security Service to view more information on the San Fransisco 1950 biological testing. In summary, the military released Serratia marcescens upon the San Fransisco population to test the effectiveness of a terrorist bio-attack. Following this was an outbreak of pneumonia which killed on man.

9) **Streptomyces** - "Streptomycetes are used to produce the majority of antibiotics applied in human and veterinary medicine and agriculture, as well as anti-parasitic agents, herbicides, pharmacologically active metabolites (e.g. immuno-suppressants) "

10) A restriction enzyme used in research labs to snip and combine DNA -- such an enzyme cleaves open DNA and allows desired segments to be inserted before recombining.

11) Other bacteria and toxic molds capable of producing heart disease, encephalitis, meningitis, as well as acute upper respiratory and gastrointestinal distress.

It is known that within three days of a particular heavy spraying, outbreaks of respiratory illnesses occur in the exposed population. Some develop pneumonia, others colds, flu-like symptoms, and depressed immune functions. Instances of meningitis and encephalitis have also increased in correlation with sprayings.

Note that no viruses are listed above. This is because viruses are difficult to detect in the laboratory, much less identify. However, most of the resulting illnesses do not respond to antibiotics, suggesting their causes are indeed viral. From points made later in this article, such viruses are most likely retroviruses such as the adenovirus for use in sinister gene 'therapy.'

It has been discussed what is in chemtrails, but how particularly are they generated and for what reasons?

Account of an Airline Mechanic

An airline mechanic describes his accidental discovery of a commercial plane's chemtrail pumping system:

...When I got into the bay I realized that something was not right. There were more tanks, pumps, and pipes than should have been there. At first I assumed that the system had been changed. It had been 10 years since I had worked on one. As I tried to find the problem I quickly realized the extra piping and tanks were not connected to the waste disposal system.

...The next day I was on the company computer to look up a wiring schematic. While I was there I decided to look up the extra equipment I had found. To my amazement the manuals did not show any of the extra equipment I had seen with my own eyes the day before.

...The system had 1 large and 2 smaller tanks. It was hard to tell in the cramped compartment but it looked like the large tank could hold 50 gallons.

Later is a response from an airline manager concerning Project Cloverleaf:

"...Airline companies in America have been participating in something called Project Cloverleaf for a few years now. The earliest date anyone remembers being briefed on it is 1998. I was briefed on it in 1999.

...They told us that the government was going to pay our airline, along with others, to release special chemicals from commercial aircraft.

When asked what the chemicals were and why we were going to spray them, they told us that information was given on a need-to-know basis and we weren't cleared for it. They then went on to state that the chemicals were harmless, but the program was of such importance that it needed to be done at all costs. When we asked them why didn't they just rig military aircraft to spray these chemicals, they stated that there weren't enough military aircraft available to release chemicals on such a large basis as needs to be done. That's why Project Cloverleaf was initiated, to allow commercial airlines to assist in releasing these chemicals into the atmosphere.

Someone asked one of the G-men then if the chemicals are harmless, why not tell the

public what the chemicals are and why we are spraying them? He seemed perturbed at this question and told us in a tone of authority that the public doesn't need to know what's going on, but that this program is in their best interests."

The veracity of these comments are uncertain, but with other circumstantial evidence at hand, they appear to be truthful. They suggest that for at least the past two years, commercial airlines have participated in dispersing unknown substances during regular flight, unbeknownst to all but the waste disposal mechanics and need-to know staff.

How Chemtrails are Dispersed

Next comes the question of how exactly chemtrails are dispersed. This was hinted at in the airline mechanic's account of seeing three tanks containing liquid. The purpose of these three tanks is evident when present patented technology is taken into account.

Here is the abstract of patent # 03994437:

A method and apparatus are provided for evenly disseminating by broadcast techniques trace quantities of biologically active chemicals such as nutrients, insecticides, fungicides, growth regulators and the like. The biologically active chemical is encapsulated in a microdispenser such as a filamentary conduit of regulated cross-section and length. The filled microdispensers are then metered into a moving carrier fluid stream, preferably air, and the carrier fluid containing the microdispensers is then evenly dispersed throughout the area. In an alternate preferred embodiment, the microdispensers are coated with a second material which may be either another biologically active material or a sticker for attaching the microdispenser to living organisms such as plants or animals. The method and apparatus is also applicable to biologically active chemicals contained in laminated microdispenser structures for dissemination and release.

In the actual patent, however, the author states that the fiber sizes are quite large, with inside diameters of 7-50 mils and lengths of two inches. These sizes he states, are preferred, though not limiting numbers. It is possible that this technology has been updated to produce microfilaments such as the 'cobwebs' seen falling from the sky after chemtrail sprayings.

What's important is the encapsulation of biologically active materials in a polymer coating. The minimum number of liquids to accomplish this is three, two to form polymers such as polyesters, polyolefins, acrylics, modacrylics, polyamides upon reaction during mixing with one another, and the third being the biologically active liquid. Another patent entitled "ENCAPSULATION BY INTERFACIAL POLYCONDENSATION" 3577515, describes this process perfectly.

Overview of the Chemtrail Phenomenon

Chemtrails appear worldwide, though it has been claimed that none have been sighted in China. The author has personally witnessed them in Germany. Although chemtrails in foreign countries may be due to planes originating from the US, or from US military bases in those countries, the heaviness of spraying there suggests that foreign governments and commercial agencies are involved. As stated, this contradicts the hypothesis that chemtrails are sprayed to protect Americans from an anthrax attack, as

terrorists would not target countries other than America, especially many of the lesser countries in which chemtrails have still been sighted.

What is to be gleaned from the preceding point is that governments worldwide are involved in aggressively spraying the population with agents that have biological effects. They are in a hurry, considering their frequency and density of coverage, as if a deadline is to be met. The project has risked discovery by employing commercial airlines to help with the spraying, and such a risk can only be justified if the project itself were in the nature of an emergency. They have also risked their secrecy by spraying during the day to affect as many people as possible, when all below can plainly see these contrails are anything but.

What worldwide emergency could be of such importance and threat to the world governments?

Piece 2: Bacterially Induced Transcession and Gene Therapy via Vector Viruses

This section concerns altering one's DNA via incorporation of foreign DNA from bacteria or viruses.

First Clue that Viruses Affect Host's DNA

The term 'transcession' appears in a Leading Edge article, quoted as follows:

"One of the indications that vaccinations may in fact be changing the genetic structure of humans became evident in September of 1971, when scientists at the University of Geneva made the discovery that biological substances entering directly into the bloodstream could become part of human genetic structure. In one experiment, scientists in Geneva extracted the auricles of frog hearts and dipped them for several hours in a suspension of bacteria.

Afterward, they found a high percentage of RNA-DNA hybridization between bacterial DNA extracted from bacteria of the same species as that used in the experiment and titrated DNA extracted from the auricles which had been dipped in the bacterial suspension. Bacterial DNA had been absorbed by the animal cells. This phenomenon has been dubbed transcession. There is evidence that this kind of phenomenon is happening all the time within the human body. It is conceivable, for example, that heart damage following rheumatic fever could be the result of the immune system reacting to its own cells producing a foreign RNA complex after absorption of foreign DNA." (link)

For those interested in the transcession capability of vaccines, consider this quote about gene therapy:

"Yet another technique is to simply inject naked DNA. This approach wouldn't work well as direct injection into the bloodstream because the body's DNA degrading enzymes would quickly digest it. But some experiments have shown that when naked DNA is injected directly into muscle tissue [as in a vaccine injection], say, the cells start producing whatever proteins the DNA codes for. (from this link on gene therapy)

In other words, transfection is the process whereby bacterial DNA becomes part of a host cell's DNA. The term transfection is more commonly known as transduction, or conjugation, more generally termed horizontal gene transfer. Horizontal means between species, as opposed to vertical which is from parent to offspring.

Gene Therapy Employs Viruses to Alter Host DNA

This is one way how gene therapy, which seeks to correct genetic diseases, works. Visit this animation for a short tutorial on how viruses are used in gene therapy.

Here's another excerpt from an article confirming the use of viruses in gene therapy:

"To turn viruses into gene ferries, scientists have developed ways of stripping the genes out of a virus and substituting copies of the genes they want to transfer into cells. The virus is then mixed with cells taken out of the body that are then returned. Or they can be injected directly into the body itself, homing in on the cells of interest. Retroviruses, which insert their genetic code directly into the chromosomes of the host cell, have been used a lot because of their ability to break into chromosomes and insert the DNA. Other viruses are now also being used. One of the big drawbacks of viruses is that the immune system can't tell the difference between bad viruses and those that carry a beneficial gene. So, many of the viruses are rapidly wiped out [that is, of course, unless the immune system is weakened by other chemical/biological agents such that these viruses survive long enough to transduce their DNA into the host]." (link)

Methods of Applying Gene Therapy via Virus Vectors to Patients

Non-invasive methods of gene therapy are already well established. A team at the Thomas Jefferson University in Philadelphia accomplished just that using an oral method of gene therapy:

Dr. Doring and his colleagues inserted a beta-galactosidase gene--which encodes for an enzyme that breaks down lactose--into an adeno-associated virus vector. They then gave this orally through a special tube to lactose-intolerant rats. The gene incorporated into the cells lining the rats' gastrointestinal tract, allowing them to break down lactose.

"We showed several important things," he says. "We could deliver a gene noninvasively, we could achieve long-term gene expression through a simple oral route, and there was enough gene expression to treat a disease such as lactose intolerance." (link)

Even madsci.org has something to say about these non-invasive methods:

Gene therapy is one of the most interesting and valuable techniques to come out of the field of genetic engineering. The adenovirus used to deliver the CF gene to human cells for gene therapy is known as a vector. Since most cells normally will not take in or absorb DNA, we need a delivery system to get the gene into the cell. Adenovirus is a good vector since it can infect cells in vivo, or while they're in the body, which means that the gene can be delivered through an inhaler (instead of having to manipulate the cells in vitro, or in the laboratory, then return the cells to the body). To use the adenovirus as a vector, it's genome was first altered by removing all the virus DNA except for the minimum necessary for the virus to live and infect the cells. Genetically engineered viral vectors like this are harmless and usually can't live outside of the laboratory. (link)

But some virus vectors are not without drawbacks:

All viral approaches suffer from the drawback of introducing unwanted viral genetic information into the recipient host. Retroviral vectors and adenoviruses have additional disadvantages. Retroviruses are only suitable for delivery of DNA to replicating cells, and present a risk of reversion to replication competent infective particles, whilst DNA expression using adenovirus delivery systems tends to be short lived [thus the repeated chemtrail sprayings over the past two years in the same geographic areas and the use of a host of vectors to ensure success when one fails] (link).

Later in the article, one solution to the problem is proposed:

"...Novel vectors for gene therapy are therefore needed which avoid the potential risks of using viral material, but can stably transfer exogenous DNA to target cells, to sites and at levels that produce a therapeutic effect.

A novel vector with potential for use in gene therapy has been developed by Professor Beverly Griffin and colleagues in the Department of Infectious Diseases at the Hammersmith Hospital Campus of Imperial College(1). Her team has shown that pseudocapsids of the mouse polyoma virus, consisting solely of the VP1 protein, can be used to transfer DNA into mammalian cells in vivo, to give expression at clinically-relevant levels over a period of weeks.

Polyoma virus has a very broad host range which means that the pseudocapsids will be taken up by essentially any human or other mammalian cell. Development and selection of mutant VP1 proteins, together with engineered specific labels may enable cell-specific targeting for in vivo applications. Pseudocapsids completely free of viral genetic material can be produced easily and economically.

Polyoma pseudocapsids can successfully transfer up to 7.2 Kb of DNA and research is investigating the production of oversized pseudocapsids. These oversized capsids would enable transfer of much larger amounts of genetic material than is currently possible with adeno or retrovirus vectors. "

In other words, technology already exists allowing virus vectors to effectively alter the DNA of a host's cell. This is not science fiction. One company among many, AEA Technology, is presently researching and selling aerosol (most likely inhaler, but expandable to atmospheric) products for use in gene therapy.

Physical Symptoms of Virus Vector Afflictions

Different types of viral vectors exist, including retroviral, adenoviral, adeno-associated, herpes simplex, and vaccinia vectors (source). The University of Rochester Biosafety Committee made the following precautions on using adenovirus and herpes virus vectors in medical research:

Adenovirus: Adenoviruses are infectious human viruses, which often cause mild respiratory illness. Rare cases of severe disease can occur, and its use as a genetic vector therefore requires the use of adequate containment equipment and practices. Biosafety Level 2 (BL2) is appropriate for many constructs (see above). Particular care should be given to vectors containing genes that make products that may be similar to products made by the deleted adenovirus genes.

Herpesvirus: Herpesviruses include infectious human viruses such as herpes simplex

virus type-1 (HSV-1), which is the most commonly used vector system. HSV-1 is common in the general population, but can cause encephalitis in rare cases; its utility as a vector system stems from its broad host cell range, ability to transduce neurons, and its large insert capacity. Biosafety Level 2 (BL2) is appropriate for many constructs (see above).

From evidence available, adenovirus vectors are the most likely culprits in chemtrail-related sicknesses.

In summary, both bacteria and viruses are capable of incorporating some of their own genetic information into the cells of a host. Bacteria do it via transduction and conjugation, and viruses via direct infection of a cell.

The Link to Chemtrails

Conceivably, one could become infected with either such a bacteria or virus and would feel sick as a consequence. Meanwhile, the bacteria or virus go to work altering one's cellular DNA slowly, before later being wiped out by the body's immune system. After the illness is eliminated, the altered cells remain and continue to reproduce. Sometimes it becomes malignantly cancerous if the gene transfer is crude and faulty (as in vaccinations), and other times the changes are so subtle the body continues to operate as previously, or so the victim thinks (as in chemtrail exposure).

As mentioned, chemtrails contain genetically engineered biological agents and make people sick. Does this not hint at an intentional attempt by the implementors of the chemtrail program to perform mass gene therapy upon the population? The question is whether or not this gene therapy is for our benefit, or the benefit of the implementors. Considering how sick many have gotten, some to the point of death, and the overall ominous secrecy involved, it is safe to say that the chemtrail program has sinister roots.

If governments are not spraying out of benevolence and altruism, then they are spraying the population to protect themselves. When threatened, one attacks the source of that threat. And what are chemtrails ultimately attacking? Our cellular DNA.

Therefore, there is something about our DNA that threatens the power structure. Considering chemtrails are a recent phenomenon, the threat must also be recent. If a citizen's DNA was non threatening before, but is now, then it must have fundamentally changed its structure recently. This fits the definition of 'mutation.'

The third puzzle piece reveals why such an urgent effort is being implemented to influence genes of the masses.

Piece 3: Mass Human Mutation, Evolution, and eventual Ascension.

What is a mutation? The dictionary says:

The process by which such a sudden structural change occurs, either through an alteration in the nucleotide sequence of the DNA coding for a gene or through a change in the physical arrangement of a chromosome.

The Rise of Mutant Humans

There are a great number of sources which claim that new strains of humans have been appearing over the past decade. Not all these sources are scientific, but that is expected with a topic at the fringe of current events.

One example is Drunvalo Melchizedek, who in an interview by Diane Cooper (featured at this link) said:

"Well there are 3 different kinds of children emerging in the world today that I have been able to identify. The first are called the "Super Psychic Children of China." The second are called the "Indigo Children" and the third are called the "Children of AIDS." The first one, the "Super Psychics of China," we talked about in the Flower of Life seminars. If you remember, the first one was discovered in 1984 when a child was found who was psychic beyond belief.

...Well, it's mostly children, but now they are finding adults with it too - just like the hundredth monkey theory. Now all kinds of people are being affected by it and it's spreading fast. Remember, it started just 5 years ago with almost no one and now it's spreading - just like a disease. It's like an outbreak and this is only the beginning.

...People's DNA is really changing. Barbara Marciniak talked about going to the 12-strand DNA, and I've talked about chromosome changes. There have been many of us who have talked about this - but none of this had been seen by science. Now it has been seen and it has been documented.

[for more on Drunvalo and DNA mutations, read this [Leading Edge](#) article.]

What's most interesting is his mention of the "Super Psychics of China." There are purportedly no chemtrail activities occurring in China. Could there be a link?

And speaking of Barbara Marciniak, in her book *Bringers of the Dawn*, she expands upon the topic of DNA:

"The original human was a magnificent being whose 12 strands of DNA were contributed by a variety of sentient civilizations. When the new owners [reptilians] came in, they worked in their laboratories and created versions of humans with a different DNA - the two stranded, double-helix DNA. They took the original DNA of the human species and disassembled it. The original DNA pattern was left within the human cells, yet it was not functional; it was split apart, unplugged. "

Marciniak goes on to explain that today, humans are having their 'unplugged' DNA reactivated. Whether activation of junk DNA qualifies as a 'mutation' is a question of semantics, but that shall be what it is called here.

The most revealing article can be found at this link, an interview with Dr. Berrenda Fox: *"Everyone has one double helix of DNA. What we are finding is that there are other helixes that are being formed. In the double helix there are two strands of DNA coiled into a spiral. It is my understanding that we will be developing twelve helixes. During this time, which seems to have started maybe 5 to 20 years ago, we have been mutating.*

This is the scientific explanation. It is a mutation of our species into something for which the end result is not yet known.

The changes are not known publicly, because the scientific community feels it would frighten the population. However, people are changing at the cellular level. I am working with three children right now who have three DNA helixes.

These are children who can move objects across the room just by concentrating on them, or they can fill glasses of water just by looking at them. They're telepathic. You would almost think by knowing these children that they are half angelic or superhuman, but they're not. I think they are what we are growing into during the next few decades.

The easiest way to mutate our DNA is through a virus." [in this case, the easiest way to un-mutate DNA or suppress it from mutating is with a virus. Chemtrails are not causing the mutations, as children are being born with this new mutant DNA. If chemtrails are indeed causing the mutation, then we would expect older people to possess this new DNA since they've had longer exposure, but the opposite is true]

Two Types of Mutations

This new phenomenon of mutation, when not interfered by chemtrails, includes two aspects:

- 1) Present adults are having their junk DNA activated and/or genetic code modified.
- 2) Many children born with strange (previously unseen) DNA or with activated junk DNA.

When this phenomenon started is unclear. Considering that there might be different categories of mutation, some involving mere activation of latent genes, and some incorporating a completely novel genetic code, it is safe to say that this phenomenon consists of phases. For example, one type of mutation might have begun in the 1970's, and another might have started with children born after 1995.

Implications of Mutations

The cause mutation and its implications are most relevant in explaining chemtrails. As mentioned, the power structure feels threatened by what is taking place and are targeting our DNA as a consequence. Mutations are found threatening by the power structure because first, the emergence of humans distinguishable from the rest of the population by their paranormal abilities can cause panic and civil unrest (coupled with racism as hinted in the X-Men movie) which would mean premature implementation of martial law and resulting risk of revolution. Second, with increasing numbers of 'enlightened' humans, the illusion foisted upon us by the power structure will crumble -- even if only by the 100th monkey phenomenon whereby enlightenment spreads rapidly and contagiously to many once a small threshold segment of the population acts as seed.

Usually, mutation is attributed to imperfect gene replication, whereby errors in the replication process result in copies of copies of defective DNA. This is one reason why we age. Other standard contributors to random mutation include ultraviolet rays from the sun (which knock out small parts of DNA, the remains of which can potentially be copied if not soon corrected by the body, potentially resulting in skin cancer), cosmic rays,

environmental pollutants, and ionizing radiation. These however, cause destructive mutations producing tumors, cancers, and freaks. What's taking place to precipitate the chemtrail program is constructive mutation, known more commonly in the long run as evolution. More likely reasons for mutations follow:

Reactivation of junk DNA

Changing earth frequencies are the principle causes of a reactivation. Earth's magnetic field strength has slowly been declining. According to a geomagnetism FAQ at the NOAA web site, based on field measurements since 1850, a reversal based on a linear model can be expected in 1,300 years. Of course, if the model is actually exponential, it could happen in the next twenty years.

It is confirmed that DNA's crystalline helical structure makes it very sensitive to low strength but specific magnetic frequencies and wave shapes. Depending on the field strength and Fourier components, the effects can vary from rejuvenation to cancer, with one possible effect being the unlocking or suppression of junk DNA. Knowing that the earth's magnetic field is the integral backbone to a global esoteric electromagnetic grid system set up in ancient times, that junk DNA has been suppressed during this time, and that the recent decrease in magnetic field strength has reached a threshold level during a period coinciding with activation of junk DNA in many, one can hypothesize that that whoever set up the original grid system did so to keep our genetic potential suppressed. This suppression has recently lost its grip, however, due in part to a declining geomagnetic field.

Interestingly, HAARP appears to be an electromagnetic aspect of a multiprong approach to artificially counteract this decline and keep mutation suppressed. Chemtrails are the biochemical aspect of the same program. Leading Edge reports at this link that the step-down reflective frequencies are "approx 1.1 GHz, Human DNA resonant frequency," creating a "cellular system phase-lock."

In addition to weakening magnetic fields, the Schumann resonant frequencies of earth (related to how long it takes an EM wave to travel around the circumference of the earth's ionosphere) have not stayed constant. This, too, has an impact on our consciousness and DNA. A research abstract entitled "*Schumann Resonance Parameter Changes During High-Energy Particle Precipitation*" states that sources of high energy particles such as solar storms have an influence on Schumann resonance. This indicates a link between earth resonance and the sun. Consequently, there is a link, however subtle, between solar activity and our DNA. Recent months have seen wild solar activity; this will reflect genetically within the population toward a reactivation of junk DNA [reactivation because wild fluctuations present unpredictability, and since the predictable earth field is one established by the power structure, anything unpredictable would serve to disrupt it].

Modification of DNA Sequence

Influx of walk-ins, alien souls, or attached entities account for this modification. DNA is sensitive to more than just electromagnetic fields. It also responds to the body's soul-nature. Soul nature is the vibrational etheric/astral composition or signature of a

particular soul. Genetic structure and soul-nature are intimately coupled; a change in one can lead to a delayed change in the other.

Walk-ins are souls who replace the native soul in a body. If the soul nature is different, then DNA will change accordingly. Walk-ins can include alien souls, though this occurs only in instances of replacement by negatively oriented aliens since positive ones are reluctant to violate freewill, and kicking a native soul out of a body is definitely violation to freewill. Most people are reluctant to go willingly.

Attached entities are souls who invade and share a body with a native soul. These are usually deceased humans irresponsibly or accidentally attaching themselves to living persons. The two soul-natures heterodyne and affect the DNA and physiology in a shared manner (schizophrenic patients facial features often change significantly after the onset of the mental disease, which often is the result of an invasion by multiple attached entities. There have also been cases of victims of spirit attachment developing a disease having afflicted the attached entity in its previous life.

As far as the mutation phenomenon chemtrails seek to combat, if walk-ins are indeed one source of DNA modification, then the souls walking in are of alien origin. If they were of human origin, no threat would be present as this has been taking place for thousands of years.

Combined Hypothesis of What the Chemtrail Program is Combating

The best hypothesis, given the range of data pertaining to chemtrails and soul dynamics as well as the UFO phenomenon, show that the chemtrail program is potentially targeting some or all these distinct groups:

1) ordinary citizens whose junk DNA are in the process of fully activating -- a consequence of earth's decreasing magnetic field, increase in resonance frequency, increase in global consciousness (which evolves humanity's collective morphogenic field and has a corresponding genetic effect upon its individuals), and possibly other more esoteric reasons such as a change in the very structure of space and time preceding the grand dimensional nexus of 2012-2013.

2) children born with fully activated DNA -- same reasons as case 1, but growing fetal cells are more susceptible to earth fields than fully integrated adult cells.

3) children with alien genetics from physical hybridization by greys -- undoubtedly, some children of abductees have alien genes, though so subtly that little physiological signs if any show it. More insidious is a scenario proposed by the x-files, that aliens are turning us into them via a virus (movies and TV shows often clue us into what's really going on, one method that the positive factions of secret societies help mankind). If humans are indeed being hybridized en masse, especially from within by means of viruses or alien manipulation of the earth grid, then the government has reason to combat it using chemtrails. However, people presently affected by this change (whatever it may be) are more positive, responsible, intelligent, and aware. Therefore, one shouldn't conclude that

chemtrails are helping us.

4) human babies born with alien souls, whose DNA is rapidly changing from human to alien -- these humans are born with souls from a new alien faction, and since soul-nature and DNA are coupled, the human body soon changes genetically to accommodate the alien soul. It is said new alien faction because old alien factions comprise the bulk of normal human souls anyway. Because chemtrails are a new phenomenon, if alien souls are indeed being born into human bodies, they must be alien souls from a new faction. Considering the positive nature of these mutants, it is probably a positive faction here to help mankind get through the coming end time turmoil.

Conclusion

Humanity is evolving, emerging from the past millennia of abysmal darkness and oppression. The power structure, knowing its reign is about to end, has worked tirelessly in a last ditch effort to keep us suppressed. Chemtrails are but one small weapon they are employing to accomplish this.

Their ultimate goal is a New World Order, global totalitarianism and a reinstatement of their absolute power. The NWO will fail if citizens become genetically empowered to wake up and fight with superhuman powers against tyranny. This is already occurring, and chemtrails are ultimately ineffectual at preventing the inevitable.

Few know the chemtrail program's true purpose, and most of those implementing it have been told lies. They believe the "mass vaccination" scenario, that what they are doing is beneficial to citizens. Unfortunately this illusion, like all others created by the power structure, shall fall away in due time.

That time is rapidly approaching. Chemtrails are merely delaying what is destined, and what is destined is the glorious revival of human sovereignty and victory of the human spirit.
